FIRE RESISTANT CABLES

The Last Cable Standing
Our commitment to environmentally friendly products.
Cavicel is committed to providing our customers with environmentally friendly products in compliance with the European Union (EU) RoHS Directive (Restriction of Hazardous Substances) and REACH Regulation (Registration, Evaluation, Authorization and Restriction of Chemicals).
Fires have a high cost in terms of loss of human life and damages to plants and structures.

Fire is the major cause of destruction, but we must consider that one of the main causes of death are the inhalation of toxic gas that develop and the presence of dense smoke, interfering with the identification of escape routes.

It has to be kept into consideration, then, that even the most sophisticated alarm systems or emergency systems can be useless if their performances are compromised by the destruction of the cables caused by the fire. This is the reason why, over the last few years, the companies have strongly invested in design and development of insulation materials and cables granting the best performances in case of fire, while reducing fumes and acid gases emission and granting the circuit integrity even in case of fire.

Cavicel has been present for more than 30 years onto the market with its own research, products and experience.

*Experience is our Power.*

With this catalogue we try to show you our experience, our way of thinking and operating in the creation of fire resistant cables. We believe the cables you will see are good practical examples. When it comes to your own cable we can co-design it together: you let us know your specific situation and we will create your cable all around it.

*Cavicel can create it for you.*
Fire Performance

CABLES HAVE TO BE PROPERLY DESIGNED, MANUFACTURED AND ALSO TESTED.

The behavior of cables concerning flame presence covers various aspects. A first feature is how the cable reacts in these circumstances. This brought us to consider two performances:

FLAME RETARDANT

FIRE RESISTANT

Flame retardant cables can resist the spread of fire, but due to fire the cable is fully destroyed and no circuit integrity is assured. All the systems connected to cables are completely out of work. Flame retardant cables are not intended to assure service during a fire but are chosen to prevent the flame spreading.

Fire resistant cables maintain circuit integrity and continue to work in the presence of fire. It is important for fire alarm systems, emergency lighting, voice alarm systems... In this case it is possible to assure building evacuation, alarm signals, activation of extinguishing systems. Fire resistant cables are always as well Flame retardant as they assure the highest level of security during a fire.

GAS EMISSION / SMOKE DENSITY

Other features should be considered in this context. More precisely, these are the quality and the quantity of gas that are developed during the fire. In fact, the cause of fire victims often doesn’t only consists in the presence of fire, but it’s also due to the gases that develop from the burning of materials. One of the most popular material used for insulation and jacket for electrical cables is PVC. This material can show excellent flame retardant properties, due to the presence of chlorine in the compound, that is a flame suppressant. On the other hand, chlorine is a corrosive and toxic gas and it develops an heavy smoke. All of these characteristics have to be avoided in case of fire. This is why the following features have to be considered:

Absence of halogen (acid gas) in the cables

Low emission of smoke

Specific tests, according to different standards, are therefore defined to verify this performance.

The tests are part of R&D, an extremely strategic activity for a Company and this is the reason why CAVICEL has invested in this field. You can find here the main tests concerning the behaviour of cables under fire conditions, and our main test equipments. It is important to verify all required performances and give the customers the full compliance to the requirements. CAVICEL is proud of its own laboratories and customers are always welcome to visit them.
Fire Resistant Cables

**FIRE RESISTANCE**

**BS 6387**

Following tests are carried out to verify if a cable is capable of maintaining circuit integrity under fire condition, fire with water, and fire with mechanical shocks. During the tests the cables are maintained at their rated voltage.

- **Fire Resistance (CAT. A B C S)**
  - The cable is exposed to fire at the specified temperature and time.

- **Fire and Water Resistance (CAT. W)**
  - The cable is exposed for 15 minutes to flame at 650°C and for additional 15 minutes to fire and water spray.

- **Fire Resistance with Mechanical Shocks (CAT. X Y Z)**
  - The cable is mounted on a vertical panel and shocked with a steel bar for 15 minutes while submitted to the action of a flame.

---

**Flame calibration**
Fire Resistance

This test is carried out to verify circuit integrity during a fire. The cable is exposed to a flame at 930°C and mechanical shocks for 60 minutes and additional 60 minutes to flame, mechanical shocks and water spray.

Fire Resistance

Method for assessment of fire integrity of large diameter power cables. This test is carried out to verify circuit integrity of cables exposed to fire, mechanical shock and water spray. A sample of cable is held on a flame about 830°C, for a minimum of 120 minutes. The sample is subject of a mechanical shock, directly on the cable, every 10 minutes. 5 minutes before the end of the test, the cable is run over by a strong jet of water (2.5 l/min.) for a period of 5 seconds, at intervals of 60 seconds.

Temperature graph - BS 8434-2

Difference between temperature - BS 8434-2

Flame calibration

Flame, mechanical shock and water spray
Fire Resistance

This test is carried out to verify circuit integrity even during a fire. A sample of cable is held on a flame at about 750°C for a period of minimum 90 min, under rated voltage. No break or short circuit should occur. The test can also be performed in more severe conditions, up to 1100 °C. Fibre optic cables can be tested in same conditions, monitoring the attenuation of the signal of one or more fibres.

Classification
CEI 20-36/2-1 – IEC 60331-21 – Electrical cables up to 0.6/1 kV
CEI 20-36/2-3 – IEC 60331-23 – Data cables
CEI 20-36/2-5 – IEC 60331-25 – Fibre optic cables

NF C 32-070 CR1

Fire Resistance

This test is carried out to verify circuit integrity during a fire. The cable is into a tubular oven with gradually increasing of temperature up to 920°C. The cable is stressed by mechanical shocks and subjected to tensile strength.
Fire propagation test on bunched cables

Samples of cables 3.5 m long in quantities required by standard are installed on a ladder inside a metallic cabinet. They are subjected to the action of a flame at 750°C for a specific time (20 or 40 minutes). Cables must not burn for more than 2.5 m.

Flame Propagation Test on a Single Cable

A 60 cm long sample of cable is vertically fixed with two clamps inside a small cabin, open on the front. The cable is subjected to the action of a flame produced by a calibrated Bunsen burner. The application time of the flame is according to the cable diameter (60-480 seconds). At the end of the test the burnt portion of cable must not be 50 mm close to the higher clamp.
**GAS EMISSION**

### HCl Emission

Each non metallic material of the cable (~1.0 g) is burnt into a tube furnace up to 800 °C. A controlled air flow rate absorbs the generated gases in a appropriate solution. The titration of the solution allows to determine the developed hydrochloric acid (HCl) amount.

### Gas Corrosivity

This test allows estimation of corrosiveness against metals of gases released when cables burn. Materials composing the cable are burnt into a tubular oven with temperature higher than 935 °C. A controlled air flow rate absorbs the generated gases in a specific distilled water solution. pH and conductivity are finally measured.

**SMOKE DENSITY**

**BS EN 61034-2, IEC 61034-2, CEI 20-37/3**

### Smoke Density

In a 3 m cube metal cabinet, samples of cables are burned by 100 cm³ of alcohol contained in a metal tray. A photometric system is based on a light source and a photocell placed horizontally in the mid vertical plane of the cube, at height of 2.15 m. Absorbance or light transmission are measured.

FIRE RESISTANT CABLES
CONSTRUCTION AND GENERAL INFORMATION

Sheath
To optimize the behaviour in case of fire, the sheath is made of LSZH (Lows Smoke Zero Halogen) materials since, thanks to that, fire is not propagated, toxic or corrosive gases are not developed and a minimum quantity of white fumes are emitted.
Other materials can obviously be used in case of specific installation requirements, such as:
PVC, for example, where a higher resistance to oils and chemicals is required (but this material contains halogens, so it emits acid gas and smoke);
PE, when a higher resistance to water and moisture is required (this material is no anti-flame, though).

Armouring
Metallic armour are used when cables have to be installed by direct buried, or if mechanical protection is required. Following points must be considered:
• Required tensile load
• Expected pressure on cable during service
• Protection against rodent
• Protection against accidental damage
• Minimum required bending radius.

SWA: single layer of galvanized steel wires, with diameters according to relevant standards, coverage min. 90%. This armour assures a very good mechanical protection and tensile strength. An additional counterspiral tape increases solidity, if required.

GSWB: galvanized steel wire braid, diameter of wire: 0.20 - 0.25 - 0.30 - 0.40 mm, with coverage of >80%. It assures a good mechanical resistance, allowing a lower bending radius compared to other armour. It is preferable when there is movement or vibration.
For special application it is possible to use stainless steel, tinned copper or special alloy wires.
Cavicel, Conducting Value

Fire Resistant Cables

Conductors
Conductors can generally be according to EN 60228:

CLASS 1  
**solid**

CLASS 2  
**stranded**

CLASS 5  
**flexible**

Type of conductors are chosen according to electrical characteristics, required flexibility, type of connection systems or specific installation conditions, for example:

- in presence of vibration or movement or reduced bending radius it is preferable class 5 flexible conductor,
- class 1 solid conductor is preferable for permanent installation, crimping termination,
- in presence of corrosive atmosphere, high temperature or to facilitate the soldering it is preferable tinned conductor.

Insulation
The most widespread technologies to guarantee the electric cables connection integrity during a fire is currently the following:

- ceramified silicone-rubber
- mica-glass tape and cross-linked polyolefine

The taping with mica tape is the most typical solution; it allows the use of several insulation materials since the fire resistance is guaranteed by the tape.

The silicone rubber is currently the most frequently used solution because it simplifies and speeds up the installation, thanks to the easy peeling and to the lack of tape.

Screening
Screens are often used in instrumentation cables to prevent or reduce possible interference in cables that can be caused by the following reasons:

- Cross-talk between adjacent pairs or triples;
- Interference induced by an external source such as electrical equipments, machinery, power line.

The most popular screen is:

**ALUMINIUM/POLYESTER TAPE**
with a tinned copper drain wire or earth conductor

Following screens can also been used, when required:

**COPPER/POLYESTER TAPE**
with a tinned copper drain wire, for a better screen effect

**BARE COPPER BRAID**
for electromagnetic interference or when the cable is subject to movements

Cabling
Fire resistant cables generally can be laid-up in concentric construction and in pairs.

Twisting is important to reduce noise in circuits and also the lay of twist in some constructions must be carefully considered.
FIRECEL SR 114H
Silicone Insulation / Overall Screen
Solid & Stranded conductor

CABLE CONSTRUCTION
Conductors
Plain annealed copper wire, solid class 1 or stranded class 2 according to EN 60228.
Insulation
High performance fire resistant silicone rubber type E12 to BS EN 50363-1.
Cabling
Insulated cores are cabled together.
Overall screen
Aluminium/polyester tape.
Circuit protective conductor or drain wire
Uninsulated tinned copper conductor of the same section and class as the insulated conductors in the 2-, 3- and 4-core cables. Drain wire of 0.5 mm² tinned copper conductor is provided in cables with more than 4 conductors.
Outer sheath
LSZH thermoplastic material type LTS3 to BS 7655-6.1.
Colour red or white (other colours on request).

APPLICATIONS
FIRECEL SR 114H are primarily intended for general application. Typical applications are:
- BS 5839-1 for standard fire resistant cables in fire detection and fire alarm systems for building
- BS 5839-8 for voice alarm systems
- BS 5839-9 for emergency voice communication systems.
- BS 5266-1 for emergency lighting of premises (PH60)
- BS 8519 for fire-resistant control cable systems for life safety and fire-fighting application - Category 1

CABLE CONSTRUCTION

Conductors
Plain annealed electrolytic copper wire according to EN 60228 class 1 (U) solid or class 2 (R) stranded.

Insulation
High performance fire resistant silicone rubber.

Twisting
The insulated cores shall be twisted in pairs for a good reduction of the electromagnetic noise.

Cabling
The pairs are cabled with suitable non hygroscopic fillers (when necessary) and wrapped with polyester tape if required.

Overall screen
Aluminium/polyester tape, coverage >100%, aluminium in contact with tinned copper drain wire.

Armoured

approximate values
Firecel SR 225H are designed, manufactured and tested as data transmission cables for emergency services. These are used for data, voice and signal transmission when high frequency signal has to be assured also in the event of a fire.

Operating temperature:
-40°C to +90°C.

Minimum bending radius:
- Not armoured type: 12 times the outer diameter.
- Armoured type: 15 times the outer diameter.

### Cable Construction

**Conductors**
Plain annealed electrolytic copper wire according to EN 60228 class 2 (R) stranded.

**Insulation**
Mica/Glass tape plus XLPE.

**Twisting**
The insulated cores shall be twisted in pairs for a good reduction of the electromagnetic noise.

**Cabling**
The pairs are cabled with suitable non hygroscopic fillers (when necessary) and wrapped with polyester tape if required.

**Overall screen**
Aluminium/polyester tape, coverage >100%, aluminium in contact with tinned copper drain wire.

**Armoured**
Inner sheath: LSZH thermoplastic material.
Armour: Single layer of galvanized steel wires (SWA).
Outer sheath: LSZH thermoplastic material.

### Applicable Standards

- Basic design: EN 50288-7
- Fire resistant: IEC 60331-23
- Flame retardant: IEC 60332-1-2
- Fire retardant: IEC 60332-3-24 (cat. C)
- Halogen free properties: IEC 60754-1
- Low smoke emission: IEC 61034-2

### Applications

Firecel SR 225H are designed, manufactured and tested as data transmission cables for emergency services. These are used for data, voice and signal transmission when high frequency signal has to be assured also in the event of a fire.

### Operating Temperature

-40°C to +90°C.

### Minimum Bending Radius

- Not armoured type: 12 times the outer diameter.
- Armoured type: 15 times the outer diameter.

### Electrical Characteristics

- Cross section (mm²): 0,75, 1, 1,5
- Capacitance (pF/m): 150, 150, 150
- L/R (µH/Ohm): 25, 25, 40

Approximate values.
FIRECEL SR 228 – PA/GA
Multi-pair Individual and Overall Screen/Mica+XLPE Insulation

APPLICATIONS
Firecel SR 228 are designed, manufactured and tested for Public Address/General Alarm (PA/GA) system to significantly improve system integrity and functionality.

OPERATING TEMPERATURE
-40°C to +90°C.

MINIMUM BENDING RADIUS
Not armoured type
12 times the outer diameter.
Armoured type
15 times the outer diameter.

CABLE CONSTRUCTION
Conductors
Flexible annealed electrolytic copper wire according to EN 60228.

Insulation
Mica/Glass tape plus XLPE.

Twisting
The insulated cores shall be twisted in pairs for a good reduction of the electromagnetic noise.

Individual screen
Aluminium/polyester tape, coverage >100%, aluminium in contact with tinned copper drain wire 0.5 mm².

Cabling
The screened pairs are cabled with suitable non hygroscopic fillers (when necessary) and wrapped with polyester tape if required.

Overall screen
Aluminium/polyester tape, coverage >100%, aluminium in contact with tinned copper drain wire 0.5 mm².

Armoured
Inner sheath: LSZH thermoplastic material.
Armour: Single layer of galvanized steel wires (SWA).
Outer sheath: LSZH thermoplastic material.

## FIRECEL SR 118

**Silicone Insulation**

### SR / LSZH 300/500 V

**APPLICATIONS**

FIRECEL SR 118 are designed, manufactured and tested as control cable for emergency services and fire circuit control.

**OPERATING TEMPERATURE**

-40 °C / +90 °C

### CABLE CONSTRUCTION

**Conductors**

Plain annealed copper wire, solid class 1 or stranded class 2 according to EN 60228.

**Insulation**

High performance fire resistant silicone rubber type E12 to BS EN 50363-1.

**Cabling**

Insulated cores are cabled together.

**Outer sheath**

LSZH thermoplastic material type LTS3 according BS 7655.

FIRECEL SR 220
Mica/XLPE Insulation

**CABLE CONSTRUCTION**

**Conductors**
Plain annealed copper wire, stranded according to EN 60228 class 2.

**Insulation**
Mica/Glass fire resistant tape covered by extruded cross-linked XLPE compound.

**Cabling**
Insulated cores cabled together.

**Outer sheath**
LSZH thermoplastic material.
Colour orange or white (other colours on request).

**APPLICATIONS**

FIRECEL SR 220 are designed, manufactured and tested for general application.

**OPERATING TEMPERATURE**
-40°C to +90°C

Approximate values

**CABLE CONSTRUCTION**

**Conductors**
Plain annealed copper wire, stranded according to EN 60228 class 2.

**Insulation**
Mica/Glass fire resistant tape covered by extruded cross-linked XLPE compound.

**Cabling**
Insulated cores are cabled together.

**Outer sheath**
LSZH thermoplastic material type ST8. Colour red (other colours on request).

**COLOUR CODE TO HD 308**

- **Without earth conductor**
  - 2 cores: ●
  - 3 cores: ●●
  - 4 cores: ●●●●
  - 5 cores: ●●●●●

- **With earth conductor**
  - 3 cores: ●●●
  - 4 cores: ●●●●/●
  - 5 cores: ●●●●/●●

**APPLICABLE STANDARDS**

- **Basic design** IEC 60502-1
- **Fire resistant** IEC 60331-21
- **Flame retardant** IEC 60332-1-2
- **Fire retardant** IEC 60332-3-24 (cat. C)
- **Acid gas emission** IEC 60754-1
- **Smoke density** IEC 61034-2

**APPLICATIONS**
Power supply and signal transmission, indoors or outdoors even wet environment. For fixed laying in free air, in pipe or conduit, on masonry and metal structures or suspended. In places where in case of fire people are exposed to serious risks due to the emission of smoke, toxic and corrosive gases and where you want to avoid damage to facilities, equipment, goods. Suitable for feeding of: emergency exits, alarm signals, warning of smoke or gas, escalators. Suitable for laying underground direct or indirect.

**OPERATING TEMPERATURE**
-40°C to +90°C

**MINIMUM BENDING RADIUS**
10 times the outer diameter.
**CABLE CONSTRUCTION**

**Conductors**
Plain annealed copper wire, stranded class 2 for section up to 10 mm² or flexible class 5 for section above 10 mm² according to EN 60228.

**Insulation**
High performance fire resistant silicone rubber.

**Cabling**
Insulated cores are cabled together.

**Outer sheath**
Extruded LSZH thermoplastic material. Colour red (other colours on request).

**COLOUR CODE TO HD 308**

<td>The insulated cores shall be twisted in pairs and wrapped with glass fibre tape.</td>
</tr>
<tr>
<td>Cabling</td>
<td>The pairs are cabled together around a central cross separator filler</td>
</tr>
<tr>
<td>Overall screen</td>
<td>Copper/polyester tape, outside in contact with a bare copper braid</td>
</tr>
<tr>
<td>Outer sheath</td>
<td>LSZH thermoplastic material, red colour</td>
</tr>
</tbody>
</table>

### Applications
Signal transmission, indoor installation in places where in case of fire people are exposed to serious risks for emission of smoke, toxic and corrosive gases and where you want to avoid damage to facilities, equipment, goods. This type of cable is used in structured cabling for computer networks such as Ethernet.

### Operating Temperature
-20°C to 70°C

### Minimum Bending Radius
15 times the outer diameter

### Colour Code to HD 308

### Applicable Standards
- Standard reference: IEC 61156-5; EN 50288-5-1; EN 50289-4-16; ISO/IEC 11801; EN 50173; EN 50200
- Flame retardant IEC 60332-1-2
- Fire retardant IEC 60332-3-24 (cat. C)
- Fire resistant BS EN 50200 (class PH120)
- Acid gas emission: BS EN 60754-1
- Smoke density BS EN 61034-2

### Electrical Characteristics
- Max DC conductor resistance: 59.4 Ω/km
- Max operating voltage: 125 Vac
- Min insulation resistance: 2.0 GΩ x km
- Capacitance @800 Hz: 65 pF/m
- Characteristic Impedance: 100 Ω (± 15%)
- Velocity of propagation: 66%
- Delay skew: 20 nsec/100 m
## SLO/MLO

### Loose Buffered Cables

<td>2.0</td>
<td>20.5</td>
</tr>
</tbody>
</table>

### Applications

These cables are used inside buildings, tunnels or closed areas in general, also for outdoor application for instrumentation and Oil & Gas applications.

### Operating Temperature

-40°C to +90°C

### Minimum Bending Radius

10 times the outer diameter.

### Cable Construction

#### Fibres

Singlemode and multimode fibres, with loose technology coating.

#### Structure

- For type SLO-FR the jelly filled tube containing the fibres is reinforced with glass yarns and is wound with a flame resistant tape.
- For type MLO-FR the jelly filled tubes containing the fibres are individually wound with a mica tape and are cabled around a central steel or FRP (fibreglass reinforced plastic) element. When necessary glass yarn is the traction element. A flame resistant tape improves fire resistance.

#### Inner Sheath (only for A1 and A3 armoured cables)

LSZH thermoplastic compound.

#### Armouring

- **A1** Galvanized steel wire braid
- **A3** Corrugated steel tape
- **A5** Anti-rodent glass yarns

#### Outer Sheath

LSZH thermoplastic compound.

Colour red (other colours on request).

### Applicable Standards

**Basic design**

- BS 7629

**Fire resistant**

- BS 6387 – CWZ
- IEC 60331-25
- IEC 60332-1-2
- IEC 60332-3-24 (cat. C)

**Acid gas emission**

- BS EN 60754-1
- BS EN 60754-2

**Smoke density**

- IEC 61034-2

### Available Upon Request

#### Armouring

- **A7** Steel wire armour

-10 °C / + 70 °C (installation)

MINIMUM BENDING RADIUS

20 times overall diameter (dynamic)
10 times overall diameter (static)

CABLE CONSTRUCTION

Fibres
Singlemode and multimode fibres, with loose technology coating.

Structure
The jelly filled tubes containing the fibres are individually wound with a mica tape and are cabled around a central steel or FRP (fibreglass reinforced plastic) element. A flame resistant tape improves fire resistance.

Inner sheath
LSZH (M1) compound.

Armouring
A1 Galvanized steel wire braid

Outer sheath
QFCI type: LSZH - SHF1 (M1) compound
QFCU type: oil and mud resistant LSZH - SHF2 (M1) compound

APPLICABLE STANDARDS

Optical fibre characteristics
IEC 60793-1

Optical fibre cable characteristics
IEC 60793-1

Fire Resistant
IEC 60331-25  EN 50200 PH30/PH120

Fire retardant
IEC 60332-3  EN 60332-3

Flame retardant
IEC 60332-1-2  EN 60332-1-2

Acid gas emission:
EN 60754-1 / IEC 60754-1
EN 60754-2 / IEC 60754-12

Smoke density
IEC 61034-2  EN 50268-2

Cables for offshore installation
NEK 606
Cavicel firmly believes in the importance of the quality of its products and it undertakes to produce them using clean technologies for the respect and the protection of the environment.
